## IN THE CLAIMS:

Please amend the claims as follows:

Claim 1 (Currently Amended): A transmissive-type organic electroluminescent display device, comprising:

a substrate including sub-pixel regions thereon;

an array element in each sub-pixel area that includes thin film transistors;

a partition wall at a border portion between adjacent sub-pixel regions made of a transparent insulating material;

a first electrode made of a transparent conductive material in each sub-pixel region between adjacent partition walls, the transparent conductive material disposed on an upper surface of the partition wall, wherein the first electrode contacts the adjacent partition walls;

an organic electroluminescent layer on the first electrode in each sub-pixel region between the adjacent partition walls;

a second electrode made of a transparent conductive material on the organic electroluminescent layer; and

a passivation layer covering the second electrode.

Claim 2 (Original): The device according to claim 1, wherein the organic electroluminescent layer is made of a high molecular material.

Application No.: 10/665,369

Page 3

Claim 3 (Original): The device according to claim 1, wherein the partition wall forms an

opening having a rectangular shape corresponding to the sub-pixel region.

Claim 4 (Original): The device according to claim 1, wherein the partition wall forms an

opening having a circular shape corresponding to the sub-pixel region.

Claim 5 (Original): The device according to claim 4, wherein the organic

electroluminescent layer is formed by an ink jet method.

Claim 6 (Original): The device according to claim 1, wherein the partition wall is formed

only in a first direction at a border portion between adjacent sub-pixels.

Claim 7 (Original): The device according to claim 6, wherein the organic

electroluminescent layer is formed by a roll coating method.

Claim 8 (Original): The device according to claim 1, wherein the organic

electroluminescent layer is formed by one of an ink jet method, a roll coating method and a

nozzle coating method.

Claim 9 (Original): The device according to claim 1, wherein the partition wall has a

thickness within a range of about 1 μm to about 8 μm.

1-WA/2527658.1

Application No.: 10/665,369

Page 4

Claim 10 (Original): The device according to claim 1, wherein the partition wall is made

of a transparent organic insulating material.

Claim 11 (Original): The device according to claim 1, wherein the first electrode is an

anode electrode and the second electrode is a cathode electrode, wherein the second electrode

includes a metallic thin film having a low work function contacting the organic

electroluminescent layer.

Claim 12 (Original): The device according to claim 11, wherein the metallic thin film

includes at least one of aluminum, calcium, magnesium, lithium fluoride and alkali metals.

Claim 13 (Original): The device according to claim 1, wherein the transparent

conductive material for one of the first and second electrodes includes at least one selected from

indium tin oxide, indium zinc oxide and indium tin zinc oxide.

Application No.: 10/665,369

Page 5

Claim 14 (Currently Amended): A transmissive-type organic electroluminescent display device, comprising:

a substrate including sub-pixel regions;

a first electrode made of a first transparent conductive material;

a partition wall made of a transparent insulating material at a border portion between adjacent sub-pixel regions, the partition wall including an upper surface having a portion of the first transparent conductive material, wherein the first electrode contacts the adjacent partition walls;

an organic electroluminescent layer in each sub-pixel region between adjacent partition walls; and

a second electrode made of a second transparent conductive material on the organic electroluminescent layer between the adjacent partition walls.

Claim 15 (Original): The device according to claim 14, wherein the first and second transparent conductive materials includes at least one of indium tin oxide, indium zinc oxide and indium tin zinc oxide.

Claim 16 (Currently Amended): A method of fabricating a transmissive-type organic

electroluminescent device, comprising:

forming array elements having thin film transistors in sub-pixel regions of a substrate;

forming a partition wall at a border portion between adjacent sub-pixel regions, the

partition wall being made of a transparent insulating material;

forming a first electrode in each sub-pixel region between adjacent partition walls, the

first electrode being made of a first transparent conductive material, wherein the first electrode

contacts the adjacent partition walls;

forming an organic electroluminescent layer on the first electrode between the adjacent

partition walls, the organic electroluminescent layer being made of a high molecular material;

forming a second electrode on the entire substrate including the organic

electroluminescent layer, the second electrode being made of a second transparent conductive

material, and

encapsulating the substrate including the second electrode by forming a passivation layer

thereon,

wherein an upper surface of the partition wall includes a portion of the first transparent

conductive material.

Claim 17 (Original): The method according to claim 16, wherein forming the organic

electroluminescent layer includes using one of an ink jet method, a roll coating method and a

nozzle coating method.

Application No.: 10/665,369

Page 7

Claim 18 (Original): The method according to claim 16, wherein the transparent

insulating material is an organic insulating material.

Claim 19 (Original): The method according to claim 16, wherein the first and second

transparent conductive materials includes at least one of indium tin oxide, indium zinc oxide and

indium tin zinc oxide.
